RideFast BI Case Study

Business Problem Analysis & Strategic Recommendations

Executive Summary

RideFast is facing several operational and growth-related challenges that are negatively impacting customer experience, ride fulfillment, and long-term business performance. Analysis of ride requests, cancellation patterns, promotional effectiveness, user retention, and city-level performance revealed multiple critical issues affecting platform efficiency.

Key findings include a high ride failure rate, excessive driver cancellations, ineffective promotional spending, severe user churn, and significant underperformance in the Northgate region. These issues collectively impact revenue generation, customer satisfaction, and sustainable market growth.

The following sections outline the major business problems identified through data analysis, along with supporting evidence, root cause hypotheses, recommended actions, and measurable success metrics.

Dashboard Overview

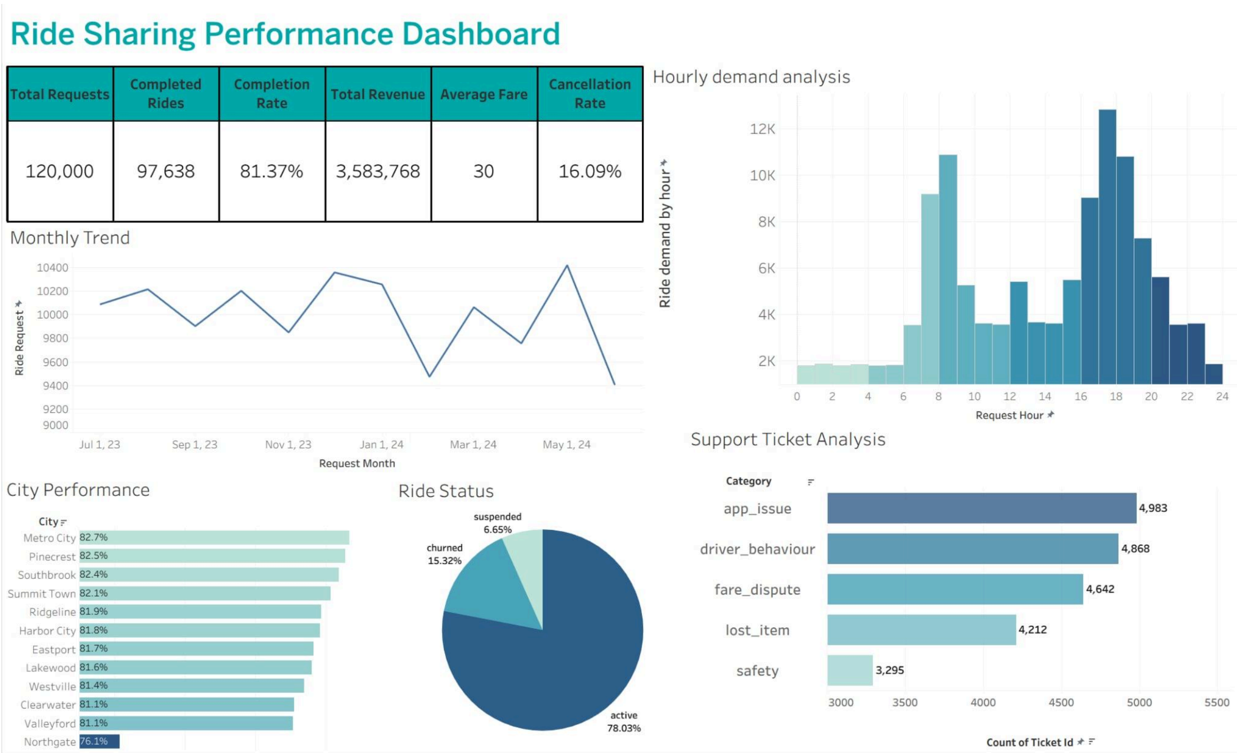

Figure 1: RideFast Performance Dashboard Overview showing key KPIs, ride demand trends, city performance, ride status distribution, and support ticket analysis.

Problem 1: High Ride Failure Rate

Problem Statement

RideFast is experiencing a significant ride fulfillment problem, with a large percentage of ride requests failing instead of being successfully completed. This issue directly impacts customer satisfaction, operational efficiency, and overall revenue generation.

Evidence

- Total Ride Requests: 120,000
- Completed Rides: 97,638
- Completion Rate: 81.37%
- Failed Rides: 18.63%

Total Requests	Completed Rides	Completion Rate	Total Revenue	Average Fare	Cancellation Rate
120,000	97,638	81.37%	3,583,768	30	16.09%

Figure 2: KPI overview showing ride request volume, completion rate, and failed ride performance.

- Driver Cancellations: 9.26%
- User Cancellations: 6.83%
- No-Show Rides: 2.54%

This means nearly 1 out of every 5 ride requests fails, indicating a significant operational reliability issue.

Business Impact

A high ride failure rate reduces platform reliability and damages customer trust, potentially leading to lower retention and reduced repeat usage.

Root Cause Hypothesis

The failure rate appears to be driven by operational inefficiencies, unreliable driver fulfillment, and long rider wait times that cause both drivers and users to abandon rides.

Recommended Action

- Implement driver reliability monitoring
- Improve ride-driver matching algorithms

- Introduce cancellation penalties for repeated cancellations
- Enhance real-time ETA communication for riders
- Optimize dispatch efficiency during peak hours

Success Metric

- Increase Completion Rate from 81.37% to 90%+
- Reduce Failed Ride Rate below 10%

Problem 2: Driver Cancellation Problem

Problem Statement

Driver-side cancellations are a major operational issue, significantly contributing to ride failures and reducing overall platform reliability.

Evidence

- Driver Cancellations: **9.26% of all rides**
- Northgate Driver Cancellation Rate: **12.95%**
- Driver cancellations account for almost half of all failed rides.
- Hourly demand analysis shows significant ride request spikes during **7–8 AM** and **5–6 PM**, indicating peak-time operational pressure that may contribute to higher cancellation rates.

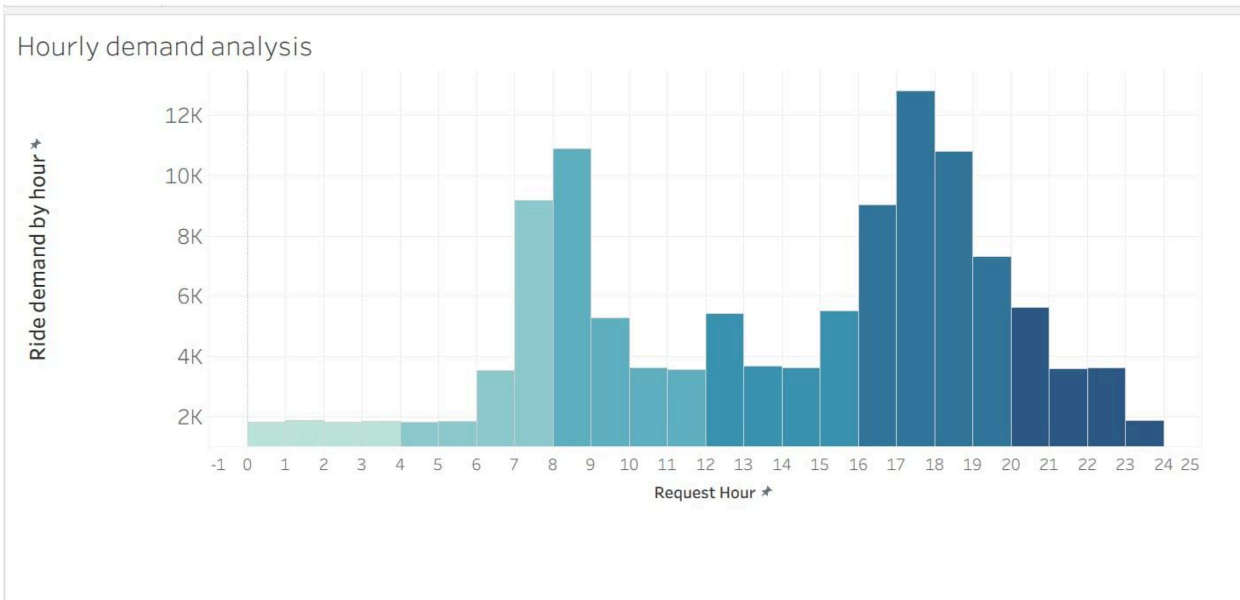

Figure 3: Hourly demand analysis showing peak ride request periods that may contribute to driver cancellations due to increased operational pressure.

Business Impact

Frequent driver cancellations reduce customer confidence, increase rider frustration, and negatively affect overall service reliability.

Root Cause Hypothesis

Drivers may be accepting rides with low commitment due to:

- Weak incentive structures
- Long pickup distances
- Poor route optimization
- Lack of accountability mechanisms
- Supply-demand imbalance in certain regions
- Peak-hour supply-demand imbalance causing driver overload and delayed pickups

Recommended Action

- Introduce driver performance scorecards
- Implement reliability-based incentives
- Apply cancellation penalties for repeated offenders
- Improve dispatch optimization
- Reduce excessive pickup distances through smarter ride allocation
- Increase driver availability during high-demand periods

Success Metric

- Reduce Driver Cancellation Rate from 9.26% to below 5%
- Improve ride fulfillment consistency across all cities
- Reduce peak-hour cancellation spikes

Problem 3: Promotion Inefficiency

Problem Statement

RideFast's promotional campaigns are generating discount costs without measurable improvement in ride completion or overall platform performance. Promotional rides show no significant uplift in completion rate compared to non-promo rides, despite incurring additional discount expenditure.

Evidence

Table 1: Promotional vs Non-Promotional Ride Performance Comparison

Category	Total Requests	Completed Rides	Completion Rate	Average Fare	Average Discount
Promo Rides	18,768	15,276	81.39%	$23.30	$9.55
Non-Promo Rides	101,232	82,362	81.36%	$31.08	$0.00

Completion rates between promo and non-promo rides are almost identical.

Business Impact

The company is incurring significant promotional expenses without generating meaningful operational improvement or increased ride completion.

Root Cause Hypothesis

Promotions may be distributed too broadly rather than being strategically targeted toward:

- High-value customers
- Retention campaigns
- Reactivation campaigns
- Churn prevention strategies

Recommended Action

- Replace blanket discounting with targeted promotions
- Perform customer segmentation and cohort analysis

- Introduce A/B testing for promotional campaigns
- Focus discounts on retention and reactivation objectives
- Measure campaign ROI continuously

Success Metric

- Increase promotional conversion uplift by 10%+
- Reduce ineffective discount spending
- Improve overall promotional ROI

Problem 4: High User Churn

Problem Statement

RideFast is experiencing a significant customer retention concern, with a large majority of users classified as churned.

Evidence

- Total Users: 35,000
- Churned Users: 27,867
- Churn Rate: 79.62%

Active Users

- Average Total Rides: 34.10
- Average Promo Rides: 11.20
- Average Wallet Balance: $69.55

Churned Users

- Average Total Rides: 30.11
- Average Promo Rides: 3.31

- Average Wallet Balance: $39.89

Even users with relatively high ride activity are leaving the platform.

Business Impact

High churn significantly limits long-term growth, reduces customer lifetime value, and increases customer acquisition costs.

Root Cause Hypothesis

Potential causes may include:

- Inconsistent service quality
- Poor customer experience
- Weak loyalty programs
- Insufficient engagement strategies
- Ride failures and cancellations reducing trust in the platform

Recommended Action

- Develop churn prediction models
- Launch retention-focused campaigns
- Introduce loyalty and rewards programs
- Implement personalized engagement strategies
- Create targeted win-back campaigns for inactive users

Success Metric

- Reduce churn by 10–15% over the next 6 months
- Increase repeat rider retention
- Improve monthly active user growth

Problem 5: Northgate Underperformance

Problem Statement

Northgate is the weakest-performing city within RideFast's network and requires targeted operational intervention.

Evidence

Northgate Performance

- Completion Rate: 76.14% (Lowest)
- Driver Cancellation Rate: 12.95% (Highest)
- Average Rating: 3.97 (Lowest)

Comparison: Metro City

- Completion Rate: 82.67%

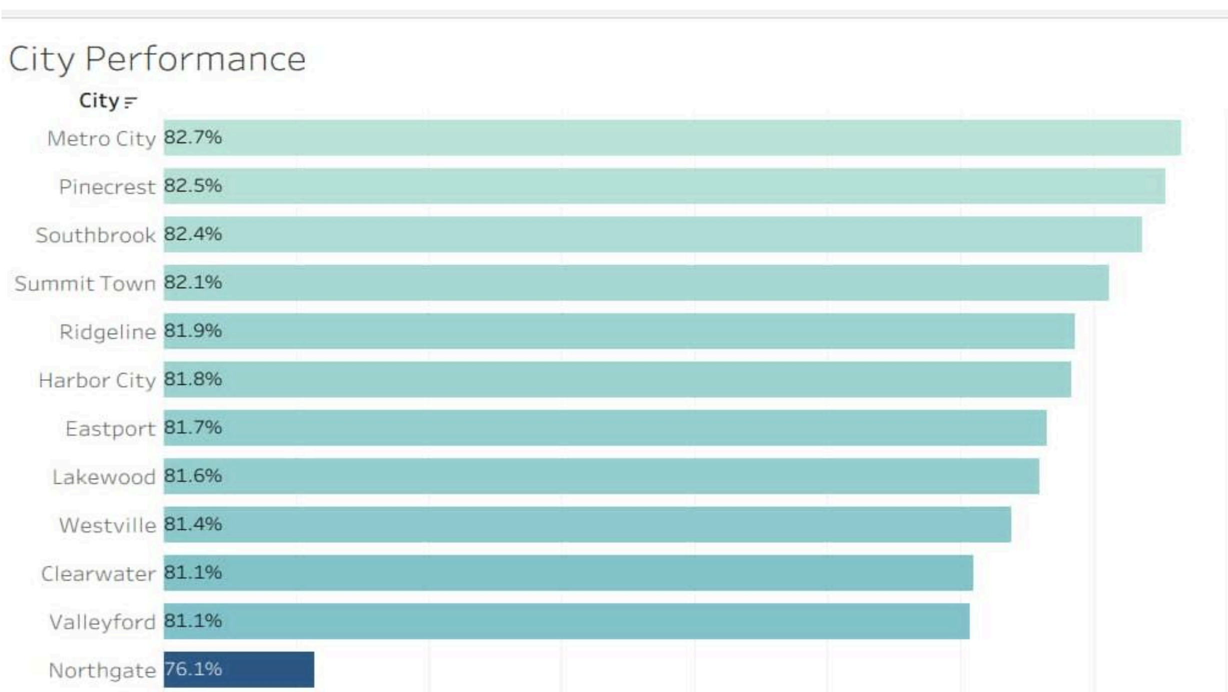

Figure 4: City performance comparison highlighting Northgate as the weakest-performing region.

The data indicates that Northgate is significantly underperforming compared to other operational regions.

Business Impact

Poor city-level performance can damage brand perception, reduce regional growth opportunities, and increase customer dissatisfaction.

Root Cause Hypothesis

Northgate may be facing:

- Driver shortages
- Weak service quality
- Inefficient dispatch systems
- Local supply-demand imbalance
- Poor operational monitoring

Recommended Action

- Increase reliable driver supply in Northgate
- Improve local dispatch optimization
- Investigate operational bottlenecks specific to the city
- Monitor city-level KPIs weekly
- Introduce targeted driver incentive programs for the region

Success Metric

- Increase Northgate Completion Rate to 82%+
- Reduce driver cancellations significantly
- Improve average rating above 4.2

Final Conclusion

The RideFast BI analysis identified several critical operational and business challenges impacting ride fulfillment, customer retention, and revenue efficiency. The most significant issues include high ride failure rates, excessive driver cancellations, ineffective promotional spending, significant user churn, and regional underperformance in Northgate.

The interactive Tableau Public dashboard, accessible here: https://public.tableau.com/app/profile/nowshin.reza3088/viz/Book1_17798121408580/Dashboard3, supports the findings presented in this report by providing deeper insights into operational performance, ride fulfillment, customer behavior, and regional performance trends.

Addressing these issues through operational optimization, targeted retention strategies, improved driver accountability, and data-driven promotional planning can significantly improve platform performance and customer satisfaction.

By implementing the recommended actions and continuously monitoring key business metrics, RideFast can strengthen operational efficiency, improve rider trust, and support long-term sustainable growth.
